

Cushion Tire Forklift Attachments

Cushion Tire Forklift Attachment - Cushion tires have a smooth profile on a firm tire with its tread being cemented to a steel ring so as to shape the tire. The tire is pressed on the hub that is then mounted onto the lift truck. These tires are ideal to utilize in smooth floor warehouses and are accessible in several polyurethane or rubber compounds.

A poly tire has polyurethane as a substitute for rubber and is likewise a solid tire. They are utilized rather than cushion tires for those applications that require a lower steering effort or a higher tire load capacity than could be obtained making use of the cushion tire. Poly tires come in in a range of hardness ratings to meet different particular application needs. Narrow Aisle models and Orderpicker lift trucks will typically use small diameter poly tires for their outrigger load wheels.
